

Why Can't I Comment?...

I've been so head down, on several projects professional and personal, that I only just noticed a few weeks worth of error messages in Cutter's Crossing's email box. A very odd error about missing a captcha-hash-variable kinda thing (don't have one handy). So, I get my next door co-worker to pull up my blog and ask him to post a comment, any comment. Low and behold, in place of the captcha there was a broken image icon. That wonderful clear box with the red X going through it, that we all know and love. Simply reinitializing **BlogCFC** took care of the issue, but I realize I've missed out on valuable feedback.

If you're reading this, and you tried to comment earlier, please try again, and I'm sorry for the trouble. I'll try to keep a more vigilant eye.

In the meantime, I'm looking for some really outstanding (public) examples of a drag-and-drop page content editor interface. Some experimenting with some of the **Ext** (2.1) sample code says I should be able to do it, but I'm looking to see some clear cut, and tested, solutions. BTW, if you haven't looked at the extended examples that they put out with the 2.1 update, then you should. There's some very nice stuff in there, particularly dealing with layouts.
